

# Package ‘ProfessR’

January 20, 2025

**Type** Package

**Title** Grades Setting and Exam Maker

**Version** 2.4-3

**Date** 2023-08-09

**Depends** R (>= 2.12)

**Imports** RPMG

**Author** Jonathan M. Lees [aut, cre]

**Maintainer** Jonathan M. Lees <jonathan.lees@unc.edu>

**Description** Programs to determine student grades and create examinations from Question banks. Programs will create numerous multiple choice exams, randomly shuffled, for different versions of same question list.

**License** GPL (>= 2)

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2023-08-21 08:42:38 UTC

ProfessR-package

*Grades Setting and Exam Maker*

---

### Description

Programs to determine student grades and create examinations from Question banks. Programs will create numerous multiple choice exams, randomly shuffled, for different versions of same question list.

### Author(s)

Jonathan M. Lees

Maintainer: Jonathan M. Lees&lt;jonathan.lees@unc.edu&gt;

## Examples

```
##### making tests:

## Not run:
data(QBANK1)
make.exam(QBANK1, ofile="exam1.tex")

## End(Not run)

##### setting grades:
g = rnorm(n=130, m=82, sd=10)
g[g>100] = 100
g[g<1] = 1

B = boxplot(g)

divs = c(min(g), B$stats[1:4] + diff(B$stats)/2, max(g) )

D1 = do.grades(g, divs=divs, tit="GEOL 105 Exam 1")
```

---

autoemail

*AutoEmail*

---

## Description

Automatically email a file to an address using the perl program.

## Usage

```
autoemail(eadd, sfile, hnote = "Exam Results")
```

## Arguments

eadd	Email address
sfile	file to be sent
hnote	subject line

## Details

This program will work well in Linux and Mac where Perl is installed - I am not sure about Windows. Creates a unix executable file, if perl is present.

**Value**

Side Effects.

**Note**

Need to change the from designation.

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

IDandEM

---

CHECKbank

*Check a set of Question banks*

---

**Description**

Sequentially check a set of Question banks. Makes sure there is a QUESTION: and ANSWER for each question.

**Usage**

CHECKbank (QB)

**Arguments**

QB                    list of question banks

**Value**

Printed Side Effects

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

seebank

**Examples**

```
data(QBANK1)
CHECKbank(QBANK1)

##### modify by inserting an error:
QBANK1[[4]]$numANS=NULL

### recheck:
CHECKbank(QBANK1)
```

---

checkgrades

*Check Grade Distribution*

---

**Description**

View grades sorted and listed with raw score, letter and scaled score, with optional ID and name

**Usage**

```
checkgrades(D1, id = NULL, names = NULL)
```

**Arguments**

D1	output of do.grades
id	character vector, ID for students
names	character vector, names of students

**Value**

Side effects

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

do.grades, DUMPgrades

**Examples**

```
g = rnorm(n=130, m=82, sd=10)
g[g>100] = 100
g[g<1] = 1

B = boxplot(g)

divs = c(min(g), B$stats[1:4] + diff(B$stats)/2, max(g) )

### to run interactively, remove the divs
### D1 = do.grades(g, tit="GEOL 105 Exam 1")

### otherwise use previously calculated divs:
D1 = do.grades(g, divs=divs, tit="GEOL 105 Exam 1")
checkgrades(D1 )
```

---

COMPbank

*Compare Question Banks*

---

**Description**

Compare two question banks to find non-duplicated questions

**Usage**

```
COMPbank(Qbank1, Qbank2)
```

**Arguments**

Qbank1	Question Bank 1
Qbank2	Question Bank 2

**Details**

Uses match to find matching questions in the two question banks.

**Value**

Vector index of questions in Qbank2 that are not found in Qbank1.

**Note**

Only the questions are compared, the answers are ignored. The return vector will be a set of questions that are not duplicated, i.e. unique to question bank 2.

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

SELbank

**Examples**

```
## Not run:
LF = list.files(path="/home/lees/Class/GEOL_105/TESTBANK/EXAM_1", pattern="txt", full.names=TRUE )

kbank = vector(mode='list')
##### read in the question banks, each in one file
for(i in 1:length(LF))
{
  h = Get.testbank(LF[i])
  kbank[[i]] = Get.testbank(LF[i])

}
names(kbank) = LF
Kbank = vector(mode='list')

for(i in 1:length(kbank))
{

Kbank = c(Kbank, kbank[[i]])

}

q2 = COMPbank(Kbank, kbank[[3]] )

##### to extract these:
subq2 = subsetbank(kbank[[3]] , q2)
##### to get the overlapping questions:

olap = 1:length(kbank[[3]])
olap[-q2]

## End(Not run)
```

**Description**

Remove blanks from strings.

**Usage**

```
deblank(a)
```

**Arguments**

a                    Character string

**Details**

Removes all blanks from strings. The function works on vectors of strings, removing blanks on each element.

**Value**

Character string with no blanks.

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**Examples**

```
j = c(' James', 'Jones ', 'Alpha Dog')
deblank(j)
```

---

do.grades

*Do Grades*

---

**Description**

Calculate the grades of a class of students, given raw scores on exam

**Usage**

```
do.grades(ggrades, divs = NULL, cut = 0, tit = "Exam Grades",
breaks=length(ggrades)/3, ...)
```

**Arguments**

<code>ggrades</code>	Raw grades
<code>divs</code>	divisions for grades (optional)
<code>cut</code>	low end Cut off to remove 0 from statistics
<code>tit</code>	Title for Figure
<code>breaks</code>	breaks for the histogram, default=length(ggrades)/3
<code>...</code>	other parameters for hist

**Details**

To remove students who do not take the test a low end cut off is used to excise any grades below that level. Both mean, and standard deviations are shown as well as median and quartiles.

**Value**

grades=ggrades, lett=letts, scor=scores, divs=divs, LETS=LETS, SCRS=SCRS, hist=HA LIST:

<code>grades</code>	raw scores
<code>lett</code>	letter grades
<code>scor</code>	scaled grades
<code>divs</code>	divisions, estimated by user or provided as input
<code>LETS</code>	letter grades assigned
<code>SCRS</code>	Scores related to LETS
<code>hist</code>	histogram structure

**Note**

Grades are determined linearly within a division

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

jist, DUMPgrades, getlet

**Examples**

```
g = rnorm(n=130, m=82, sd=10)
g[g>100] = 100
g[g<1] = 1

B = boxplot(g)

##### set divisions automatically:
```

```

divs = c(min(g), B$stats[1:4] + diff(B$stats)/2, max(g) )

### to run interactively, remove the divs
### D1 = do.grades(g, tit="GEOL 105 Exam 1")

### otherwise use previously calculated divs:
D1 = do.grades(g, divs=divs, tit="GEOL 105 Exam 1")

## Not run:

#### this is interactive
D1 = do.grades(g, tit="GEOL 105 Exam 1")

##### list the grades:
cbind(D1$grades, D1$lett, D1$scor)

##### if you have names or ID's try:
##### cbind(IDs, D1$grades, D1$lett, D1$scor)

\dontrun{
  DUMPgrades(D1, file="TEST1grades", id=IDS )
}

## End(Not run)

```

---

droplowest

*Drop lowest grade*

---

### Description

Drop the lowest grade from a matrix of grades. Matrix is assumed to be N by m where m is the number of exams (columns), N the number of students (rows)

### Usage

```
droplowest(z)
```

### Arguments

z                    Matrix of scores, rows are students, columns are exam scores

**Details**

Best matrix output is sorted, so the grades do not reflect the original order of exam scores. To drop the two lowest scores, apply this program twice, running it a second time on the best output.

**Value**

minind	Index of minimum score
best	matrix of scores with the lowest dropped
midgrade	mean value of best scores

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

do.grades

**Examples**

```
##### generate fake exam scores, 10 students, 3 exams
z = matrix(runif(3*10, 50, 100), ncol=3 )
A = droplowest(z)
cbind(A$best, A$minind, z, A$midgrade)
```

---

DUMPBANK

*Dump a Question Bank*

---

**Description**

Save an ASCII version of a selected Question Bank

**Usage**

```
DUMPBANK(ofile, QB, sep = "\n", append=TRUE)
```

**Arguments**

ofile	character, output file
QB	QuestionBank Structure
sep	separator between questions
append	logical, if FALSE a new file is created

**Value**

Side effects

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

Get.testbank

**Examples**

```
## Not run:
data(QBANK1)
DUMPbank("my.questions", QBANK1, sep = "\n")

QB1=Get.testbank("my.questions")

## End(Not run)
```

---

DUMPgrades

*Dump grades to a file*

---

**Description**

Dump grades to a file

**Usage**

```
DUMPgrades(D1, file = NULL, id = NULL, names = NULL)
```

**Arguments**

D1	list output from do.grades
file	file name, a csv will be added as a suffix
id	vector of student IDs
names	character vector of student names

**Value**

Side effects

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

do.grades

**Examples**

```
g = rnorm(n=130, m=82, sd=10)
g[g>100] = 100
g[g<1] = 1

B = boxplot(g)

divs = c(min(g), B$stats[1:4] + diff(B$stats)/2, max(g) )

### to run interactively, remove the divs
### D1 = do.grades(g, tit="GEOL 105 Exam 1")

### otherwise use previously calculated divs:
D1 = do.grades(g, divs=divs, tit="GEOL 105 Exam 1")

## Not run:

DUMPgrades(D1, file="TEST1grades" )

## End(Not run)
```

---

DUPbank

*Find Duplicate Questions*

---

**Description**

Finds duplicated questions in a set of Question Banks

**Usage**

DUPbank(Qbank)

**Arguments**

Qbank            a list of Question Banks

**Details**

The program only checks the questions, not the answers. One could thus have several questions with the same wording, but different answers. I might change this in the future. Given the list of duplicated questions one should edit the original question bank files to remove them.

**Value**

A	vector of duplicated questions
F	vector of duplicated files where the questions were extracted
I	vector of duplicated indexes where the questions were extracted
N	vector of duplicated indexes where the questions were extracted

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**Examples**

```
data(QBANK1)

### force some questions to be duplicates:
QBANK1[[51]]=QBANK1[[25]]
QBANK1[[52]]=QBANK1[[12]]
QBANK1[[14]]=QBANK1[[4]]

DQ = DUPbank(QBANK1)

DQ
```

---

E2grades

*Examination grades from Test 2 in 2007*

---

**Description**

Real exam raw scores from test in Geology 105, University of North Carolina. Zeros are assigned to students who did not take the test.

**Usage**

```
data(E2grades)
```

**Format**

numeric vector

**Examples**

```
data(E2grades)

g = E2grades

B = boxplot(g[g>1], plot=FALSE)
divs = c(min(g), B$stats[1:4] + diff(B$stats)/2, max(g) )
```

```
### get(getOption("device"))(width = 12, height = 7)
D1 = do.grades(g, divs=divs, cut = 15, tit="GEOL 105 Exam 1")
jlist(D1$hist, D1$grades, D1$lett, col='purple')
```

---

EXAMstats

*Exam Statistics*

---

### Description

Statistical Analysis of Examination where the results are either correct or incorrect.

### Usage

```
EXAMstats(j, key)
```

### Arguments

j	matrix of student responses
key	key of correct answers

### Details

At this statge no partial credit is given.

### Value

List	
H	Matrix: question, correct response, student responses, difficulty, Desc, BiSer
kr20	Kruder-Richardson reliability statistic

### Note

There is a slightly different implementation if partial credit is employed. See

### Author(s)

Jonathan M. Lees<[jonathan.lees@unc.edu](mailto:jonathan.lees@unc.edu)>

readSCANTRON

**Examples**

```
## Not run:  
B2 = readSCANTRON(rawfn2)  
  
Estat = EXAMstats(B2$studans, B2$key)  
  
Estat$kr20  
  
## End(Not run)
```

---

fix.names

*Fix Down Loaded Names*

---

**Description**

Fix names to remove problematic alphanumeric characters like spaces, quotes

**Usage**

```
fix.names(nam, upper=FALSE, lower=FALSE)
```

**Arguments**

nam	string
upper	logical, TRUE= convert to upper case
lower	logical, TRUE= convert to lower case

**Details**

Currently only space, single and double quotes.

**Value**

string, with quote replaced with underscore

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

## Examples

```
#### examples with embedded quotes are not available
#### because they interfere with R documentation
```

```
LAM = "SILENCED LAMB"
fix.names(LAM, lower=TRUE)
```

```
LAM = "Silence my Lamb"
fix.names(LAM, upper=TRUE)
```

```
LAM = "SILeNCED LAMB"
fix.names(LAM)
```

```
### try with single quote
LAM = "O'brian LAMB"
fix.names(LAM)
```

---

Get.testbank

*Get Test Bank From Ascii Text Files*

---

## Description

Get Test Bank From Ascii Text Files

## Usage

```
Get.testbank(fn)
```

## Arguments

fn	File Name
----	-----------

## Details

Structure of input file is strict: see the vignette for an example. Each questions starts with the tag QUESTION: (there is a space following the colon on all tags) followed by answers with the correct answer indicated by the tag ANSWER: . The tag FIG: allows the examiner to include a figure with a latex tag for reference. For example: ' QUESTION: What was the world like during the Late Paleocene Torrid Age? ANSWER: a. Most of the world was wetter and warmer. b. Most of the world was drier and warmer. c. Most of the world was wetter, but a little cooler. d. Most of the world was a desert. e. It is impossible to estimate conditions at that time. '

## Value

List: list of Questions

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**Examples**

```
## Not run:
fn = "MY.questions"
Qbank = Get.testbank(fn)

##### use existing database:
data(QBANK1)
#### dump out question bank in correct format:
DUMPbank("my.questions", QBANK1, sep = "\n")
### read it in:
QB1=Get.testbank("my.questions")

## End(Not run)
```

---

getgroup

*Create Groupings of Students*

---

**Description**

Create groups of students and plot groups to screen.

**Usage**

```
getgroup(g.first, n = 2)
```

**Arguments**

<code>g.first</code>	Character vector of student names.
<code>n</code>	number per group

**Details**

Class roster will be divided into n groups and displayed on the the screen.

**Value**

List of groups with names.

**Note**

The class is currently randomized in this version.

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

GetStudentNames

**Examples**

```
g.last =c('Joyce', 'Einstein', 'Hertz', 'Bailey',  
'Compton', 'Jones', 'Wilson', 'Smith', 'Anderson' )  
  
getgroup(g.last, n = 3)
```

---

getKEY                      *Read Key output*

---

**Description**

Read Key output

**Usage**

```
getKEY(fn)
```

**Arguments**

fn                      character string file name

**Details**

Reads in the file output of ProfessR and returns a vector of answers

**Value**

vector of correct answers

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

version.exam, prep.solution

---

`getlet`*Get Letter Grades*

---

**Description**

Get letter grades from list of numeric scores

**Usage**

```
getlet(ggrades, divs)
```

**Arguments**

<code>ggrades</code>	vector of grades
<code>divs</code>	numerical vector of divisions

**Details**

Returns letter grades scaled linearly between divisions.

**Value**

LIST:

<code>ggrades</code>	Input grades
<code>lett</code>	letter values
<code>scor</code>	scores after scaling
<code>divs</code>	divisions used in setting scores
<code>LETS</code>	Letters for grades
<code>SCRS</code>	numeric divisions used for LETS
<code>olett</code>	letter values, older version
<code>oscor</code>	scores after scaling, older version binned

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

`do.grades`

**Examples**

```
g = rnorm(130, m=82, sd=10)

g[g>100] = 100
g[g<1] = 1

B = boxplot(g)

divs = c(min(g), B$stats[1:4] + diff(B$stats)/2, max(g) )

G = getlet(g, divs)

cbind(G$LETS, G$SCRS)

data.frame(G$grades, G$lett, G$scor)
```

---

GetStudentNames

*Extract Student Names from Roster.*

---

**Description**

Given a roster of students, with (lastname, first name) format, extract a unique set of first names, with no blanks.

**Usage**

```
GetStudentNames(c1, dup.lets=1)
```

**Arguments**

c1	Character vector
dup.lets	NUmber of letters to add from last name in the event that first names are duplicated.

**Details**

The function assumes the names are comma separated with lastname, firstname order. The code separates the names, removes blanks from the first name, and finds a unique set of names. If first names are not unique, the function extracts the first letters of the last names and the duplicated names and appends with a period.

**Value**

Character vector of unique first names

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**Examples**

```
g.first =c("Jason","Skyler","Adrian","Berkley","Jack",'David',  
'David', 'Jim', 'Jim')  
g.last =c('Joyce', 'Einstein', 'Hertz', 'Bailey', 'Compton',  
'Jones', 'Wilson', 'Smith', 'Anderson' )  
  
c2 = paste(g.last, g.first, sep=', ' )  
  
K = GetStudentNames(c2)
```

---

gradeSCAN

*Grade a SCANTRON*

---

**Description**

Grade each row of a matrix which is a record of the scanned answers from a test.

**Usage**

```
gradeSCAN(j, key)
```

**Arguments**

j	matrix, scanned answers from the grading center
key	vector, key for grading

**Details**

Program sums correct answers and returns the score for each row.

**Value**

vector of scores

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

---

IDandEM

*Match ID and Email file*

---

### **Description**

Match ID and Email file

### **Usage**

```
IDandEM(scrfn, sisroster, sel = 1:2, hnote = "Exam Results", SEND = TRUE)
```

### **Arguments**

scrfn	list(ID=number, nam="name on scantron")
sisroster	list(ID=number, lastname='last name of student', fullname='full name of student')
sel	numeric, index= specify for a specific student
hnote	text, subject line on E-mail
SEND	logical, if FALSE, do not send

### **Details**

A set of files has been separated and stored. Each file is to sent to a different student with the exam results.

### **Value**

Side Effects

### **Note**

The IDs of the reference data base (the roster) must match the IDs in the list of files. If not, use repair.id to fix the scantron IDs

### **Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

### **See Also**

repair.id

**Examples**

```

## Not run:
## read in the names of the files
zfile = scan(file="ALLIDS", list(name="", ID=0, tfile=""), sep=",")
## read in a roster. The roster has
## email addresses that are attached to the files
## by matching the ID in the zfile with the IDs in the data base
load(file="/home/lees/Class/GEOL_105/Grades_2008/EXAM1/BB1.RDATA")

jroster = BB1

IDandEM(zfile, jroster, sel=1:10, hnote="GEOL105 EXAM3 Results", SEND=FALSE )
IDandEM(zfile, jroster, hnote="GEOL105 EXAM3 Results", SEND=FALSE )

##### actual sending
IDandEM(zfile, jroster, hnote="GEOL105 EXAM3 Results", SEND=TRUE )

## End(Not run)

```

---

jst

---

*Add letter grades to histogram*

---

**Description**

Given a vector of grades, add the letters to an existing histogram.

**Usage**

```
jst(h, Z=1, L=1, col=2)
```

**Arguments**

h	histogram list
Z	grades from original data
L	letters associated with grades
col	color for plotting letters

**Details**

This will add information on an existing histogram plot. If h is the output of do.grades() then Z and L are ignored.

**Value**

Graphical Side effects

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

do.grades

**Examples**

```
g = rnorm(130, m=82, sd=10)
g[g>100] = 100
g[g<1] = 1

B = boxplot(g)

divs = c(min(g), B$stats[1:4] + diff(B$stats)/2, max(g) )

####G1 = do.grades(g, cut=20, tit="GEOL 105 Exam 1")

##### replot with existing divisions:
D1 = do.grades(g, divs=divs, tit="GEOL 105 Exam 1")

jlist(D1$hist, D1$grades, D1$lett)

##### or simply:

D1 = do.grades(g, divs=divs, tit="GEOL 105 Exam 1")

jlist(D1)
```

---

LETGRADE

*Letter Grade*

---

**Description**

given a numeric grade return a letter grade

**Usage**

LETGRADE(g)

**Arguments**

g                    numeric grade between 1-100

**Details**

returns a grade based on a 4 point spread

**Value**

character vector of grades

**Note**

Failing grade is "E" by default. There is no "A+" in this program (UNC policy)

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**Examples**

```
g = rnorm(25, m=82, sd=10)
g[g>100] = 100
g[g<1] = 1
```

```
L = LETGRADE(g)
```

```
cbind(g, L)
```

---

make.exam

*Make Exam*

---

**Description**

Given a question bank, create a test.

**Usage**

```
make.exam(Qbank, ofile = "examq.tex", ncol=2)
```

**Arguments**

Qbank	Question bank list
ofile	Output file
ncol	number of columns on page, default=2

**Details**

Dumps out a tex file with the questions

**Value**

Side Effects - output to a TEX file.

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

prep.exam

**Examples**

```
data(QBANK1)

## Not run:
make.exam(QBANK1, ofile="exam1.tex")

## End(Not run)
```

---

make.solution

*Create Solution File*

---

**Description**

Create Solution File in Latex

**Usage**

```
make.solution(Qbank, ofile = "answers.tex")
```

**Arguments**

Qbank	Question Bank
ofile	Output File

**Details**

Creates a latex file suitable for printing solution to the exam.

**Value**

Side Effects

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**Examples**

```
data(QBANK1)

## Not run:
make.solution(QBANK1, ofile= "solutions.tex")

## End(Not run)
```

---

phist

*Plot Histogram with Grades labeled*

---

**Description**

Plot Histogram with Grades labeled

**Usage**

```
phist(G, Z = 1, L = 1, col = 2, add = FALSE, tit = "GEOL 105 Exam 1")
```

**Arguments**

G	Histogram list from do.grades
Z	numerical grades
L	text, vector, Letter Grades
col	color for text
add	logical, add=TRUE, add to existing plot
tit	title for plot

**Value**

List:

x	x location on plot
y	y location on plot
L	Label printed

**Author(s)**

Jonathan M. Lees&lt;jonathan.lees@unc.edu&gt;

**See Also**

do.grades

**Examples**

```
## Not run:
newID3 = repair.id(DBB, raw3)
raw3$id=newID3
raw3$ID=newID3
```

```
## End(Not run)
```

---

 prep.exam

---

*Prepare Exam for Latex (simple style)*

---

**Description**

Prepare Exam for Latex - use simple styles

**Usage**

```
prep.exam(OF, incfile, instructor="", examdate="",
  course="", examname="", instructions="", ncol=2)
```

**Arguments**

OF	Character string output files
incfile	Character, include file name for questions
instructor	name of instructor
examdate	Date of the examination
course	Name of the course, character
examname	title of exam
instructions	character vector of instructions
ncol	number of columns on page, default=2

**Value**

Side Effects

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

version.exam

**Examples**

```
## Not run:
##### since the program produces a file on the local
##### system, do not run this example

examdate="THURS Sep 20 2007"

seqnum="1"
exnumber="Exam 1"

course=course, examname=examname, instructions=instructions)
}

## End(Not run)
```

---

prep.solution	<i>Prepare Solution Files</i>
---------------	-------------------------------

---

### **Description**

Prepare Latex Solution Files

### **Usage**

prep.solution(ofile)

### **Arguments**

ofile            output file name

### **Details**

Prepares the Latex header for the solution files

### **Value**

Side Effects

### **Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

### **See Also**

prep.exam

### **Examples**

```
## Not run:  
prep.solution("solfile")  
  
## End(Not run)
```

---

printSCANTRON

*Print Scantron*

---

**Description**

Print results from scantron center

**Usage**

```
printSCANTRON(B1)
```

**Arguments**

B1                   list, output of readSCANTRON: must have elements studans, Nams, ids

**Value**

side effects

**Note**

Prints the matrix returned from the scantron center.

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

readSCANTRON

**Examples**

```
## Not run:

datadir = "./DATA"
rawfn1 = paste(datadir, 't6200a.raw.csv', sep="/")

B1 = readSCANTRON(rawfn1)
printSCANTRON(B1)

## End(Not run)
```

---

QBANK1

*Example Question Bank*

---

### Description

Example Question Bank, 50 question, multiple Choice

### Usage

```
data(QBANK1)
```

### Format

List:

**Q** Question in latex format (character string)

**A** Possible Answers in latex format (vector of character strings)

**a** Correct Answer in latex format (character string)

**numANS** index number corresponding to correct answer

**FIG** character: full path to figure, tag for figure

### Details

An example input question in ascii format is constructed using three tag identifiers: "QUESTION:", "ANSWER:" and (optionally) "FIG:". The format is shown here:

### Examples

```
data(QBANK1)
## maybe str(QBANK1) ; plot(QBANK1) ...
print(QBANK1[[1]])
```

---

ran.exam

*Random order of Exam*

---

### Description

Randomly re-order the questions in a Question Bank

### Usage

```
ran.exam(Qbank)
```

**Arguments**

Qbank            Question Bank List

**Details**

randomly re-order the questions in a Question Bank

**Value**

Question bank

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

Get.testbank

**Examples**

```
data(QBANK1)
NEWQB = ran.exam(QBANK1)
```

---

readSCANTRON

*Read Scantron*

---

**Description**

Read UNC scantron

**Usage**

```
readSCANTRON(fn = "t9543b.raw.csv", nq = 50, istart = 6)
```

**Arguments**

fn                    character, name of digital file with raw scores  
nq                    integer, Number of questions to read  
istart                integer, start of column for first question

**Details**

The data is scanned by machine. If a student marks on the exam past the correct number of questions, the machine assumes there are legitimate responses beyond the key.

**Value**

list:

Nstudents	number of students
Nquestions	number of questions
Nams	names of students
ids	Ids of students
studans	matrix, student answers
key	key for grading

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**Examples**

```
## Not run:

datadir = "./DATA"
rawfn1 = paste(datadir, 't6200a.raw.csv', sep="/")

B1 = readSCANTRON(rawfn1)

## End(Not run)
```

---

rename.answers	<i>Rename Answers</i>
----------------	-----------------------

---

**Description**

Rename the answers on a Question Bank

**Usage**

```
rename.answers(Qbank, newnames = letters[1:26], sep = ") ")
```

**Arguments**

Qbank	Question Bank
newnames	vector of new names
sep	separator between name of Answer and Answer String

**Details**

Takes the given list of questions, and returns same list with answers rpefaces by a different set of itemizers

**Value**

Question Bank List

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

Get.testbank

**Examples**

```
data(QBANK1)

newnames=letters[1:26]
NEWQB = rename.answers(QBANK1, newnames=newnames )
NEWQB[[35]]

newnames=1:26
NEWQB = rename.answers(QBANK1, newnames=newnames )
NEWQB[[35]]

newnames=LETTERS[1:26]
NEWQB = rename.answers(QBANK1, newnames=newnames )
NEWQB[[35]]
```

---

repair.id

*Repair Poorly Bubbled Student ID*

---

**Description**

Repair Poorly Bubbled Student IDs by matching to a reliable data base of names and IDs. Routine offers a set of possible matches if several may be appropriate.

**Usage**

```
repair.id(sisroster, scrfn)
```

**Arguments**

sisroster	Reference Data set
scrfn	Scantron Output

**Details**

Program searchers for missing ID's by attempting to match up names.

**Value**

newid                    New vector of IDs that correspond to the scantron input

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

---

ridNA                    *Replace NA with something else*

---

**Description**

Replace NA with something else

**Usage**

```
ridNA(z, temp)
```

**Arguments**

z                        vector  
temp                    replacement

**Value**

vector with NA's replaces

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**Examples**

```
z = 1:10  
z[z>8] = NA  
  
ridNA(z, 0)
```

scramble.answers

*Scramble Answers*

---

**Description**

Randomly rearrange answers within a question of a test bank

**Usage**

```
scramble.answers(Qbank)
```

**Arguments**

Qbank                      Question Bank (list of Questions)

**Details**

Takes the given list of questions, and returns same list with answers scrambled.

**Value**

Question Bank List

**Note**

Since some question require that the answers be ordered in a certain way, these are not Randomized in this scrambling process. These include:

```
c("all of the above", "none of the above", "None of these are correct", "all of the choices  
are correct", "All of the choices are correct", "Both choices are correct", "None of the  
choices are correct", "Both of the choices are correct", "All of these are correct", 'Neither  
of these are correct')
```

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

Get.testbank

**Examples**

```
data(QBANK1)
```

```
QBANK1[[35]]
```

```
NEWQB = scramble.answers(QBANK1)  
NEWQB[[35]]
```

---

SEARCHbank

*Search Question Bank for Keyword*

---

### **Description**

Search a question bank for key words.

### **Usage**

```
SEARCHbank(gw, y = "humidity")
```

### **Arguments**

gw	Question Bank
y	key word

### **Details**

Dumps to the screen the questions that match the key.

### **Value**

Side effects - dumps to the screen. returns a vector of questions that match.

### **Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

### **See Also**

seebank,Get.testbank,SELbank,COMPbank

### **Examples**

```
## Not run:  
#### seebank program is interactive -  
data(QBANK1)  
SEARCHbank(QBANK1, "humidity" )  
  
## End(Not run)
```

seebank

*Print out a bank of questions*

---

**Description**

Prints out a bank of questions, one at a time

**Usage**

seebank(QB)

**Arguments**

QB                    QuestionBank Structure

**Value**

Side effects

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**Examples**

```
## Not run:  
#### seebank program is interactive -  
data(QBANK1)  
seebank(QBANK1)  
  
## End(Not run)
```

---

seequestions*See Questions Sequentially*

---

**Description**

Print questions to the screen

**Usage**

seequestions(QB)

### Arguments

QB                    Question Bank

### Details

Prints just the questions to the screen.

### Value

Prints to screen

### Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

### See Also

seebank

### Examples

```
## Not run:
LF = list.files(path="/home/lees/Class/GEOL_105/TESTBANK/EXAM_1", pattern="txt", full.names=TRUE )

kbank = vector(mode='list')
##### read in the question banks, each in one file
for(i in 1:length(LF))
  {
    h = Get.testbank(LF[i])
    kbank[[i]] = Get.testbank(LF[i])
  }
names(kbank) = LF

cbind( seequestions(kbank[[1]]) )

## End(Not run)
```

---

 SELbank

*Select Questions from a bank*

---

**Description**

Select, random set of questions from a test bank.

**Usage**

```
SELbank(QB, N, xclude=NULL)
```

**Arguments**

QB	Question bank
N	integer, number of questions to select
xclude	integer vector, index of questions to exclude, default=NULL

**Details**

Program uses sample to get a random perturbation, and then pulls out the first N questions

**Value**

Question bank

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

Get.testbank

**Examples**

```
## Not run:
LF = list.files(path="/home/lees/Class/GEOL_105/TESTBANK/EXAM_1", pattern="txt", full.names=TRUE )

kbank = vector(mode='list')
##### read in the question banks, each in one file
for(i in 1:length(LF))
{
  h = Get.testbank(LF[i])
  kbank[[i]] = Get.testbank(LF[i])
}
names(kbank) = LF
Kbank = vector(mode='list')
```

```
for(i in 1:length(kbank))
{
Kbank = c(Kbank, kbank[[i]])
}

##### get 50 sample questions
NEWQB = SELbank(Kbank, 50)

## End(Not run)
```

---

show.dist

*Show Distribution of Grades*

---

### **Description**

Show Distribution of Grades

### **Usage**

```
show.dist(W)
```

### **Arguments**

W                    list output of do.grades

### **Details**

Print out the distribution of letter grades

### **Value**

Side Effects

### **Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

### **See Also**

do.grades

**Examples**

```
g = rnorm(n=130, m=82, sd=10)
g[g>100] = 100
g[g<1] = 1

B = boxplot(g)

divs = c(min(g), B$stats[1:4] + diff(B$stats)/2, max(g) )
D1 = do.grades(g, divs=divs, tit="GEOL 105 Exam 1")

show.dist(D1)
```

---

subsetbank

*Subset a Question Bank*

---

**Description**

Extract a subset from a question bank

**Usage**

```
subsetbank(QBANK, sel)
```

**Arguments**

QBANK	Question Bank List
sel	integer vector of index to specific questions

**Details**

for selecting specific questions

**Value**

Question Bank with selections

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

SELbank, COMPbank

**Examples**

```
## Not run:
LF = list.files(path="/home/lees/Class/GEOL_105/TESTBANK/EXAM_1", pattern="txt", full.names=TRUE )

kbank = vector(mode='list')
##### read in the question banks, each in one file
for(i in 1:length(LF))
{
  h = Get.testbank(LF[i])
  kbank[[i]] = Get.testbank(LF[i])

}
names(kbank) = LF
Kbank = vector(mode='list')

for(i in 1:length(kbank))
{

Kbank = c(Kbank, kbank[[i]])

}

##### get 50 odd numbered sample questions

isel = seq(from=1, to=100, by=2)

oddset1 = subsetbank(Kbank, isel)

## End(Not run)
```

---

UNCkeytron

*Create a KEY for the scantron*

---

**Description**

Create a KEY for the scantron

**Usage**

```
UNCkeytron(g, fout, LAB = "KEY")
```

**Arguments**

g	vector of correct answers
fout	output file name
LAB	Label to print on key

**Details**

Given a vector of correct answers the program will create a postscript file with a facsimile of the scantron used for examinations at UNC Chapel Hill. The Bubbles will be filled and can be used to prepare a number 2 pencil version.

**Value**

Side effects

**Note**

Currently only eps outputs - future versions may be different. At this time, the code creates postscript code, which can be converted to png, pdf or other formats with software outside of R. In linux I use a perlscript,

```
/home/lees/Progs/Perl/ps2png.prl files.eps  
which, in turn, calls, epstopdf and  
gs -dBATCH -sDEVICE=png16m -dNOPAUSE -r200 -sOutputFile=$outpf $inpf
```

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

getKEY

**Examples**

```
## Not run:  
  
fkeyA = "/Users/lees/SCANTRON/A.FINAL.key"  
fkeyB = "/Users/lees/SCANTRON/B.FINAL.key"  
FKEY1 = getKEY(fkeyA)  
  
FKEY2 = getKEY(fkeyB)  
  
UNCkeytron(FKEY1, "AKEYfinal.eps", "A KEY final")  
UNCkeytron(FKEY2, "BKEYfinal.eps", "B KEY final")  
  
## End(Not run)
```

---

version.exam                      *Create 1 instance of a specific Exam*

---

**Description**

Create 1 instance of a specific Exam

**Usage**

```
version.exam(Qbank, V, exnumber = "Exam 1", seqnum = "2", examdate = '',
instructor="", course="", instructions="", SAMP=TRUE, ncol=2)
```

**Arguments**

Qbank	question bank
V	Character string output files
exnumber	Exam number
seqnum	Version Number
examdate	Date of the examination
instructor	character, name of teacher
course	character, name of course
instructions	vector of character strings
SAMP	logical, if TRUE a random ordering to the questions is produced
ncol	number of columns on page, default=2

**Value**

Side Effects

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

ran.exam, make.exam, prep.exam

**Examples**

```
## the example creates files on the local system - thus not run
## Not run:

examdate=examdate, instructor=Me, course=course , instructions=instructions)

## End(Not run)
```

---

wrist

*Write Histogram*

---

### Description

Write grades on Histogram

### Usage

```
wrist(DB)
```

### Arguments

DB                      Output of do.grades

**Details**

Used internally in plotting programs

**Value**

Side Effects

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

do.grades

**Examples**

```
