

Package ‘tscopula’

May 7, 2022

Type Package

Title Time Series Copula Models

Version 0.3.1

Date 2022-05-07

Maintainer Alexander McNeil <alexanderjmcneil@gmail.com>

Description Functions for the analysis of time series using copula models.

The package is based on methodology described in the following references.

McNeil, A.J. (2021) <[doi:10.3390/risks9010014](https://doi.org/10.3390/risks9010014)>,

acf2pacf *Compute partial autocorrelations from autocorrelations*

Description

Compute partial autocorrelations from autocorrelations

Usage

acf2pacf(rho)

Arguments

rho vector of autocorrelation values (excluding 1).

Value

A vector of partial autocorrelation values with same length as rho.

Examples

```
rho <- ARMAacf(ar = -0.9, ma = 0.8, lag.max = 50)[-1]
alpha <- acf2pacf(rho)
```

AICc	<i>Akaike Corrected Information Criterion</i>
------	---

Description

Akaike Corrected Information Criterion

Usage

```
AICc(object, ...)
```

Arguments

object a fitted model object for which there exists a logLik method to extract the corresponding log-likelihood.

... optionally more fitted model objects.

Value

If just one object is provided, a numeric value with the corresponding AICC value.

If multiple objects are provided, a data.frame with rows corresponding to the objects and columns representing the number of parameters in the model (df) and the AICC.

arma2dvine	<i>Transform an armacopula into a dvinecopula or dvinecopula2 object</i>
------------	--

Description

Transform an armacopula into a dvinecopula or dvinecopula2 object

Usage

```
arma2dvine(object)
```

Arguments

object an object of class [armacopula](#).

Value

An object of class [dvinecopula](#) (for AR copulas) or class [dvinecopula2](#) (for MA or ARMA copulas).

Examples

```
arma2dvine(armacopula(list(ar = 0.5, ma = 0.4)))
```

armacopula	<i>Constructor function for ARMA copula process</i>
------------	---

Description

Constructor function for ARMA copula process

Usage

```
armacopula(pars = list(ar = 0, ma = 0))
```

Arguments

pars list consisting of vector of AR parameters named 'ar' and vector of MA parameters named 'ma'.

Value

An object of class [armacopula](#).

Examples

```
armacopula(list(ar = 0.5, ma = 0.4))
```

armacopula-class *ARMA copula processes*

Description

Class of objects for ARMA copula processes.

Usage

```
## S4 method for signature 'armacopula'
coef(object)

## S4 method for signature 'armacopula'
show(object)

## S4 method for signature 'armacopula'
sim(object, n = 1000)

## S4 method for signature 'armacopula'
kendall(object, lagmax = 20)

## S4 method for signature 'armacopula'
predict(object, data, x, type = "df")
```

Arguments

object	an object of the class.
n	length of realization.
lagmax	maximum value of lag.
data	vector of past data values.
x	vector of arguments of prediction function.
type	type of prediction function ("df" for density, "qf" for quantile function or "dens" for density).

Methods (by generic)

- coef: Coef method for ARMA copula class
- show: Show method for ARMA copula process
- sim: Simulation method for armacopula class
- kendall: Calculate Kendall's tau values for armacopula model
- predict: Prediction method for armacopula class

Slots

`name` name of ARMA copula process.

`modelspec` vector containing number of AR and MA parameters.

`pars` list consisting of vector of AR parameters named 'ar' and vector of MA parameters named 'ma'.

Examples

```
sim(armacopula(list(ar = c(0.5, 0.4), ma = -0.8)), n = 1000)
mod <- armacopula(list(ar = 0.95, ma = -0.85))
kendall(mod)
```

armafit2dvine	<i>Transform a fitted armacopula into a fitted dvinecopula or dvinecopula2 object</i>
---------------	---

Description

Transform a fitted armacopula into a fitted dvinecopula or dvinecopula2 object

Usage

```
armafit2dvine(object)
```

Arguments

`object` an object of class [tscopulafit](#) in which the copula is of class [armacopula](#).

Value

An object of class [tscopulafit](#) in which the copula is a [dvinecopula](#) (for fitted AR copulas) or class [dvinecopula2](#) (for fitted MA or ARMA copulas).

bitcoin	<i>Bitcoin price data 2016-19</i>
---------	-----------------------------------

Description

Time series of Bitcoin closing prices from 31 December 2015 to 31 December 2019 (1044 values). This permits the calculation of 4 calendar years of returns.

Usage

```
data(bitcoin)
```

Format

An object of class "xts".

Examples

```
data(bitcoin)
plot(bitcoin)
X <- (diff(log(bitcoin))[-1]) * 100
plot(X)
```

coerce, tscopula, tscm-method

Convert tscopula object to tscm object

Description

Convert tscopula object to tscm object

Usage

```
## S4 method for signature 'tscopula,tscm'
coerce(from, to = "tsc", strict = TRUE)
```

Arguments

from a [tscopula](#) object.
to a [tscm](#) object.
strict logical variable stating whether strict coercion should be enforced.

Value

A [tscm](#) object.

coerce, tscopulafit, tscmfit-method

Convert tscopulafit object to be tscmfit object

Description

Convert tscopulafit object to be tscmfit object

Usage

```
## S4 method for signature 'tscopulafit,tscmfit'
coerce(from, to = "tscmfit", strict = TRUE)
```

Arguments

from a `tscopulafit` object.
to a `tscmfit` object.
strict logical variable stating whether strict coercion should be enforced.

Value

A `tscmfit` object.

cpi	<i>CPI inflation data 1959-2020</i>
-----	-------------------------------------

Description

Time series of US quarterly CPI (consumer price index) data Q4 1959 to Q4 2020 (245 values) for studying inflation. These data were sourced from the OECD webpage and represent the total ‘perspective’ on inflation, including food and energy. They have been based to have a value of 100 in 2015.

Usage

```
data(cpi)
```

Format

An object of class "xts".

Examples

```
data(cpi)
plot(cpi)
X <- (diff(log(cpi))[-1]) * 100
plot(X)
```

dmarg	<i>Compute density of marginal model</i>
-------	--

Description

Compute the density function of the marginal model.

Usage

```
dmarg(x, y, log = FALSE)
```

Arguments

x	an object of class <code>margin</code> .
y	vector of values for which density should be computed.
log	logical variable specifying whether log density should be returned.

Value

A vector of values for the density.

Examples

```
margmod <- margin("norm", pars = c(mean = 0, sd = 1))
dmarg(margmod, c(-2, 0, 2), log = TRUE)
```

doubleweibull	<i>Double Weibull distribution</i>
---------------	------------------------------------

Description

Double Weibull distribution

Usage

```
ddoubleweibull(x, mu = 0.05, shape = 1, scale = 1, log = FALSE)
pdoubleweibull(q, mu = 0.05, shape = 1, scale = 1)
qdoubleweibull(p, mu = 0.05, shape = 1, scale = 1)
rdoubleweibull(n, mu = 0.05, shape = 1, scale = 1)
```

Arguments

x	vector of values.
mu	location parameter.
shape	shape parameter.
scale	scale parameter.
log	flag for log density.
q	vector of quantiles.
p	vector of probabilities.
n	number of observations.

Value

A vector of density, distribution function, quantile or random values.

dvinecopula	<i>Constructor function for dvinecopula process</i>
-------------	---

Description

Constructor function for dvinecopula process

Usage

```
dvinecopula(family = "indep", pars = list(NULL), rotation = 0)
```

Arguments

family	a vector of family names
pars	a list containing the parameters of each lag
rotation	a vector of rotations

Value

An object of class [dvinecopula](#).

Examples

```
dvinecopula(family = c("joe", "gauss", "t"), pars = list(3, .5, c(1, 2)), rotation = c(180, 0, 0))
```

dvinecopula-class	<i>D-vine copula processes</i>
-------------------	--------------------------------

Description

Class of objects for d-vine copula processes.

Usage

```
## S4 method for signature 'dvinecopula'
coef(object)

## S4 method for signature 'dvinecopula'
show(object)

## S4 method for signature 'dvinecopula'
sim(object, n = 1000, innov = NA, start = NA)

## S4 method for signature 'dvinecopula'
predict(object, data, x, type = "df")

## S4 method for signature 'dvinecopula'
kendall(object, lagmax = 20)
```

Arguments

object	an object of the class.
n	length of realization.
innov	vector of innovations of length n.
start	vector of start values with length equal to order of process.
data	vector of past data values.
x	vector of arguments of prediction function.
type	type of prediction function ("df" for density, "qf" for quantile function or "dens" for density).
lagmax	maximum value of lag.

Methods (by generic)

- coef: Coef method for dvinecopula class
- show: Show method for dvinecopula class
- sim: Simulation method for dvinecopula class
- predict: Prediction method for dvinecopula class
- kendall: Calculate Kendall's tau values for pair copulas in d-vine copula

Slots

name	name of the d-vine copula process.
modelspec	list containing the family, number of parameters and rotations
pars	list comprising of the parameters.

Examples

```
sim(dvinecopula("gauss", 0.5))
mixmod <- dvinecopula(family = c("gumbel", "gauss"), pars = list(1.5, -0.6))
kendall(mixmod)
```

dvinecopula2

Constructor function for dvinecopula2 process

Description

Constructor function for dvinecopula2 process

Usage

```
dvinocopula2(
  family = "gauss",
  rotation = 0,
  kpacf = "kpacf_arma",
  pars = list(ar = 0.1, ma = 0.1),
  maxlag = Inf,
  negtau = "none"
)
```

Arguments

family	family name
rotation	rotation
kpacf	character string giving name of Kendal pacf
pars	a list containing the parameters of each lag
maxlag	scalar specifying maximum lag
negtau	character specifying treatment of negative tau values

Value

An object of class `dvinocopula2`.

Examples

```
dvinocopula2(family = "joe", kpacf = "kpacf_arma",
  pars = list(ar = 0.95, ma = -0.85), maxlag = 30)
```

dvinocopula2-class *D-vine copula processes of type 2*

Description

Class of objects for d-vine copula processes.

Usage

```
## S4 method for signature 'dvinocopula2'
coef(object)

## S4 method for signature 'dvinocopula2'
show(object)

## S4 method for signature 'dvinocopula2'
sim(object, n = 1000)
```

```
## S4 method for signature 'dvinecopula2'  
predict(object, data, x, type = "df")
```

```
## S4 method for signature 'dvinecopula2'  
kendall(object, lagmax = 20)
```

Arguments

object	an object of the class.
n	length of realization.
data	vector of past data values.
x	vector of arguments of prediction function.
type	type of prediction function ("df" for density, "qf" for quantile function or "dens" for density).
lagmax	maximum value of lag.

Methods (by generic)

- coef: Coef Method for dvinecopula2 class
- show: Show method for dvinecopula2 class
- sim: Simulation method for dvinecopula2 class
- predict: Prediction method for dvinecopula2 class
- kendall: Calculate Kendall's tau values for pair copulas in type 2 d-vine copula

Slots

name name of the d-vine copula process.

modelspec list containing the family, rotation, and name of KPACF

pars list comprising of the parameters.

Examples

```
copmod <- dvinecopula2(family = "joe", kpacf = "kpacf_arma",  
pars = list(ar = 0.95, ma = -0.85), maxlag = 30)  
kendall(copmod)
```

edf	<i>Construct empirical margin</i>
-----	-----------------------------------

Description

Construct empirical margin

Usage

```
edf()
```

Value

An object of class [margin](#) signifying an empirical distribution function.

fit	<i>Generic for estimating time series models</i>
-----	--

Description

Methods are available for objects of class [tscopulaU](#), [vtscopula](#), [tscopulafit](#), [margin](#) and [tscm](#).

Usage

```
fit(x, y, ...)
```

Arguments

x	an object of the model class.
y	a vector or time series of data.
...	further arguments to be passed on.

Value

An object of the fitted model class.

fit,margin-method *Fit method for margin class*

Description

Fit method for margin class

Usage

```
## S4 method for signature 'margin'
fit(x, y, tsoptions = list(), control = list())
```

Arguments

x	an object of class margin .
y	a vector or time series of data.
tsoptions	list of optional arguments: hessian is logical variable specifying whether Hessian matrix should be returned; start is vector of named starting values
control	list of control parameters to be passed to the optim function.

Value

An object of class [marginfit](#).

Examples

```
margmod <- margin("norm", pars = c(mean = 0, sd = 1))
data <- sim(margmod, n = 500)
fit(margmod, data)
```

fit,tscm-method *Fit method for tscm class*

Description

Fit method for tscm class

Usage

```
## S4 method for signature 'tscm'
fit(x, y, tsoptions = list(), control = list(), method = "IFM")
```

Arguments

x	an object of class tscm .
y	a vector or time series of data.
tsoptions	a list of parameters passed to fitting.
control	list of control parameters to be passed to the optim function.
method	character string specifying method.

Value

An object of class [tscmfit](#).

Examples

```
mod <- tscm(dvinecopula(family = "gauss", pars = 0.5), margin("doubleweibull"))
y <- sim(mod)
fit(mod, y)
```

fit,tscopulafit-method

Fit method for tscopulafit class

Description

Fit method for tscopulafit class

Usage

```
## S4 method for signature 'tscopulafit'
fit(x, y, tsoptions = list(), control = list(warn.1d.NelderMead = FALSE))
```

Arguments

x	an object of class tscopulafit .
y	vector or time series of data to which the copula process is to be fitted.
tsoptions	list of options
control	list of control parameters to be passed to the optim function.

Value

An object of class [tscopulafit](#).

Examples

```
ar1 <- armacopula(list(ar = 0.7))
data <- sim(ar1, 1000)
ar1fit <- fit(fit(ar1, data), sim(ar1, 1000))
```

fit,tscopulaU-method *Fit method for tscopulaU class*

Description

Fit method for tscopulaU class

Usage

```
## S4 method for signature 'tscopulaU'
fit(x, y, tsoptions = list(), control = list())
```

Arguments

x	an object of class tscopulaU .
y	vector or time series of data to which the copula process is to be fitted.
tsoptions	list of options
control	list of control parameters to be passed to the optim function.

Value

An object of class [tscopulafit](#).

Examples

```
data <- sim(armacopula(list(ar = 0.5, ma = 0.4)), n = 1000)
fit(armacopula(list(ar = 0.5, ma = 0.4)), data)
```

fit,vtscopula-method *Fit method for vtscopula class*

Description

Fit object of class [vtscopula](#) to data using maximum likelihood.

Usage

```
## S4 method for signature 'vtscopula'
fit(
  x,
  y,
  tsoptions = list(),
  control = list(maxit = 2000, warn.1d.NelderMead = FALSE)
)
```

Arguments

x	an object of class vtscopula .
y	a vector or time series of data.
tsoptions	list of optional arguments: hessian is logical variable specifying whether Hessian matrix should be returned; method is choice of optimization method.
control	list of control parameters to be passed to the optim function.

Value

An object of class [tscopulafit](#).

Examples

```
copobject <- armacopula(pars = list(ar = 0.6, ma = 0.2))
vtcop <- vtscopula(copobject, Vtransform = V2p())
y <- sim(vtcop)
fit(vtcop, y)
```

glag

Generalized lagging function

Description

Generalized lagging function

Usage

```
glag(x, lagmax = 20, glagplot = FALSE)
```

Arguments

x	an object of class tscopulafit .
lagmax	maximum value for lag.
glagplot	logical value indicating generalized lag plot.

Value

If `glagplot` is TRUE a list of generalized lagged datasets of maximum length 9 is returned to facilitate a generalized lagplot. If `glagplot` is FALSE a vector of length `lagmax` containing the Kendall rank correlations for the generalized lagged datasets is returned.

kendall	<i>Generic for Kendall correlations</i>
---------	---

Description

Methods are available for objects of class [armacopula](#), [dvinecopula](#), [dvinecopula2](#) and [vtscopula](#).

Usage

```
kendall(object, ...)
```

Arguments

object	an object of the model class.
...	further arguments to be passed to Kendall calculation.

Value

A vector of Kendall correlations.

kfilter	<i>Kalman filter for ARMA copula model</i>
---------	--

Description

Kalman filter for ARMA copula model

Usage

```
kfilter(x, y)
```

Arguments

x	an object of class armacopula .
y	a vector of data.

Value

A matrix or multivariate time series with columns consisting of conditional mean, standard deviation and residuals.

Examples

```
data <- sim(armacopula(list(ar = c(0.5, 0.4), ma = -0.8)), n = 1000)
kfilter(armacopula(list(ar = c(0.5, 0.4), ma = -0.8)), data)
```

kpacf_arfima	<i>KPACF of ARFIMA process</i>
--------------	--------------------------------

Description

KPACF of ARFIMA process

Usage

```
kpacf_arfima(k, theta)
```

Arguments

k	number of lags.
theta	list with components ar, ma and d specifying the ARFIMA parameters

Value

A vector of Kendall partial autocorrelations of length k.

kpacf_arma	<i>KPACF of ARMA process</i>
------------	------------------------------

Description

KPACF of ARMA process

Usage

```
kpacf_arma(k, theta)
```

Arguments

k	number of lags.
theta	list with components ar and ma specifying the ARMA parameters.

Value

A vector of Kendall partial autocorrelations of length k.

kpacf_fbn	<i>KPACF of fractional Brownian noise</i>
-----------	---

Description

KPACF of fractional Brownian noise

Usage

kpacf_fbn(k, theta)

Arguments

k	number of lags
theta	parameter of process

Value

A vector of Kendall partial autocorrelations of length k.

laplace	<i>Laplace distribution</i>
---------	-----------------------------

Description

Laplace distribution

Usage

```
dlaplace(x, mu = 0.05, scale = 1, log = FALSE)
plaplace(q, mu = 0.05, scale = 1)
qlaplace(p, mu = 0.05, scale = 1)
rlaplace(n, mu = 0.05, scale = 1)
```

Arguments

x	vector of values.
mu	location parameter.
scale	scale parameter.
log	flag for log density.
q	vector of quantiles.
p	vector of probabilities.
n	number of observations.

Value

A vector of density, distribution function, quantile or random values.

margin	<i>Constructor function for margin</i>
--------	--

Description

Constructor function for margin

Usage

```
margin(name, pars = NULL)
```

Arguments

name	character string giving name of distribution
pars	parameters of the distribution

Value

An object of class [margin](#).

Examples

```
margin("sst")
```

margin-class	<i>Marginal model for time series</i>
--------------	---------------------------------------

Description

Class of objects for marginal models for stationary time series. The object is given a name and there must exist functions pname, qname, dname and rname. For example, the object could be named norm and make use of [pnorm](#), [qnorm](#), [dnorm](#) and [rnorm](#). As well as the parameters of the distribution, dname must have the logical argument log specifying whether log density should be computed.

Usage

```
## S4 method for signature 'margin'
coef(object)

## S4 method for signature 'margin'
sim(object, n = 1000)

## S4 method for signature 'margin'
show(object)
```

Arguments

object an object of the class.
 n length of realization.

Methods (by generic)

- coef: Coef method for margin class
- sim: Simulation method for margin class
- show: Show method for margin class

Slots

name name of the marginal model class.
 pars a numeric vector containing the named parameters of the distribution which are passed as arguments to pname, qname, dname and rname.

Examples

```
new("margin", name = "norm", pars = c(mu = 0, sigma = 1))
margmod <- margin("norm", pars = c(mean = 0, sd = 1))
sim(margmod, n = 500)
```

marginfit-class

Fitted marginal model for time series

Description

Fitted marginal model for time series

Usage

```
## S4 method for signature 'marginfit'
logLik(object)
```

Arguments

object an object of the class.

Methods (by generic)

- logLik: logLik method for marginfit class

Slots

margin an object of class [margin](#).
 data numeric vector or time series of data.
 fit a list containing details of the maximum likelihood fit.

non_invert	<i>Check for invertibility of ARMA process</i>
------------	--

Description

Check for invertibility of ARMA process

Usage

```
non_invert(ma)
```

Arguments

ma vector of moving average parameters.

Value

A logical variable stating whether ARMA process is invertible.

non_stat	<i>Check for causality of ARMA process</i>
----------	--

Description

Check for causality of ARMA process

Usage

```
non_stat(ar)
```

Arguments

ar vector of autoregressive parameters

Value

A logical variable stating whether ARMA process is causal.

pacf2acf *Compute autocorrelations from partial autocorrelations*

Description

Compute autocorrelations from partial autocorrelations

Usage

```
pacf2acf(alpha)
```

Arguments

alpha vector of partial autocorrelation values.

Value

A vector of autocorrelation values with same length as alpha.

Examples

```
alpha <- ARMAacf(ar = -0.9, ma = 0.8, lag.max = 50, pacf = TRUE)
rho <- pacf2acf(alpha)
```

pcoincide *Compute coincidence probability for v-transform*

Description

Computes the probability that if we v-transform a uniform random variable and then stochastically invert the v-transform, we get back to the original value.

Usage

```
pcoincide(x)
```

Arguments

x an object of class [Vtransform](#).

Value

The probability of coincidence.

Examples

```
pcoincide(Vlinear(delta = 0.4))
pcoincide(V3p(delta = 0.45, kappa = 0.5, xi = 1.3))
```

pdf *Adjusted empirical distribution function*

Description

Adjusted empirical distribution function

Usage

```
pdf(x, data, proper = FALSE)
```

Arguments

x	argument of empirical distribution function.
data	vector of data for constructing empirical distribution function.
proper	logical variable which when set to TRUE will return the standard empirical distribution function.

Value

a vector of same length as x

plot,marginfit,missing-method
Plot method for marginfit class

Description

Plot method for marginfit class

Usage

```
## S4 method for signature 'marginfit,missing'  
plot(x, bw = FALSE)
```

Arguments

x	an object of class marginfit .
bw	logical variable specifying whether black-white options should be chosen.

Value

No return value, generates plot.

plot,tscmfit,missing-method

Plot method for tscmfit class

Description

Plot method for tscmfit class

Usage

```
## S4 method for signature 'tscmfit,missing'
plot(x, plottype = "residual", bw = FALSE, lagmax = 30)
```

Arguments

x	an object of class tscmfit .
plottype	type of plot required.
bw	logical variable specifying whether black-white options should be chosen.
lagmax	maximum lag value for dvinecopula2 plots

Value

No return value, generates plot.

plot,tscopulafit,missing-method

Plot method for tscopulafit class

Description

Plot method for tscopulafit class

Usage

```
## S4 method for signature 'tscopulafit,missing'
plot(x, plottype = "residual", bw = FALSE, lagmax = 30)
```

Arguments

x	an object of class tscopulafit .
plottype	type of plot required.
bw	logical variable specifying whether black-white options should be chosen.
lagmax	maximum lag value for Kendall plots

Value

No return value, generates plot.

Examples

```
data <- sim(armacopula(list(ar = 0.5, ma = 0.4)), n = 1000)
fit <- fit(armacopula(list(ar = 0.5, ma = 0.4)), data)
plot(fit)
```

plot, Vtransform, missing-method

Plot method for Vtransform class

Description

Plots the v-transform as well as its gradient or inverse. Can also plot the conditional probability that a series PIT falls below the fulcrum for a given volatility PIT value v .

Usage

```
## S4 method for signature 'Vtransform,missing'
plot(
  x,
  type = "transform",
  shading = TRUE,
  npoints = 200,
  lower = 0,
  upper = 1
)
```

Arguments

x	an object of class Vtransform .
type	type of plot: 'transform' for plot of transform, 'inverse' for plot of inverse, 'gradient' for plot of gradient or 'pdown' for plot of conditional probability.
shading	logical variable specifying whether inadmissible zone for v-transform should be shaded
npoints	number of plotting points along x-axis.
lower	the lower x-axis value for plotting.
upper	the upper x-axis value for plotting

Value

No return value, generates plot.

Examples

```
plot(Vsymmetric())
plot(V2p(delta = 0.45, kappa = 0.8), type = "inverse")
plot(V2p(delta = 0.45, kappa = 0.8), type = "gradient")
```

pmarg

Compute CDF of marginal model

Description

Compute the cumulative distribution function of the marginal model.

Usage

```
pmarg(x, q)
```

Arguments

x an object of class [margin](#).

q vector of values at which CDF should be computed.

Value

A vector of values for the CDF.

Examples

```
margmod <- margin("norm", pars = c(mean = 0, sd = 1))
pmarg(margmod, c(-2, 0, 2))
```

profilefulcrum

Profile likelihood for fulcrum parameter

Description

Profile likelihood for fulcrum parameter

Usage

```
profilefulcrum(
  data,
  tscopula = dvinecopula(family = 1, pars = list(0.1)),
  locations = seq(0, 1, by = 0.1),
  plot = TRUE
)
```

Arguments

data	a vector or time series of data on (0,1).
tscopula	an object of class tscopulaU or vtscopula .
locations	vector containing locations of different values for fulcrum.
plot	logical values specifying whether plot should be created.

Value

A matrix containing fulcrum values and log likelihood values.

Examples

```
copobject <- armacopula(pars = list(ar = 0.6, ma = 0.2))
vtcop <- vtscopula(copobject, Vtransform = V2p())
y <- sim(vtcop)
profilefulcrum(y, vtcop)
```

 qmarg

Compute quantiles of marginal model

Description

Compute the quantile function of the marginal model.

Usage

```
qmarg(x, p)
```

Arguments

x	an object of class margin .
p	vector of probabilities for which quantiles should be computed.

Value

A vector of values for the quantile function.

Examples

```
margmod <- margin("norm", pars = c(mean = 0, sd = 1))
qmarg(margmod, c(0.05, 0.5, 0.95))
```

quantile, tscmfit-method

Quantile calculation method for VT-ARMA models

Description

Quantile calculation method for VT-ARMA models

Usage

```
## S4 method for signature 'tscmfit'
quantile(x, alpha, last = FALSE)
```

Arguments

x	an object of class tscmfit based on underlying copula of class armacopula .
alpha	a scalar probability value
last	logical value asserting that only the last volatility prediction should be returned

Value

a vector of the same length as the data embedded in the tscmfit object.

safe_ses

Calculate standard errors safely

Description

Calculate standard errors safely

Usage

```
safe_ses(hess)
```

Arguments

hess	a Hessian matrix from a model fit.
------	------------------------------------

Value

a vector of standard errors.

sdoubleweibull	<i>Skew double Weibull distribution</i>
----------------	---

Description

Skew double Weibull distribution

Usage

```
dsdoubleweibull(x, mu = 0.05, shape = 1, scale = 1, gamma = 1, log = FALSE)
```

```
psdoubleweibull(q, mu = 0.05, shape = 1, scale = 1, gamma = 1)
```

```
qsdoubleweibull(p, mu = 0.05, shape = 1, scale = 1, gamma = 1)
```

```
rsdoubleweibull(n, mu = 0.05, shape = 1, scale = 1, gamma = 1)
```

Arguments

x	vector of values.
mu	location parameter.
shape	shape parameter.
scale	scale parameter.
gamma	skewness parameter.
log	flag for log density.
q	vector of quantiles.
p	vector of probabilities.
n	number of observations.

Value

A vector of density, distribution function, quantile or random values.

sigmastarma	<i>Standard deviation of innovations for armacopula</i>
-------------	---

Description

Uses the function `tacvfARMA` in the `ltsa` library.

Usage

```
sigmastarma(x)
```

Arguments

`x` an object of class [armacopula](#).

Value

The standard deviation of the standardized ARMA innovation distribution.

Examples

```
sigmastarma(armacopula(list(ar = c(0.5, 0.4), ma = -0.8)))
```

<code>sim</code>	<i>Generic for simulating time series copula models</i>
------------------	---

Description

Methods are available for objects of class [swncopula](#), [armacopula](#), [dvinecopula](#), [dvinecopula2](#), [margin](#) and [tscm](#).

Usage

```
sim(object, ...)
```

Arguments

`object` an object of the model class.
`...` further arguments to be passed to the simulation.

Value

A simulated realization from the time series model.

<code>slaplace</code>	<i>Skew Laplace distribution</i>
-----------------------	----------------------------------

Description

Skew Laplace distribution

Usage

```
dslaplace(x, mu = 0.05, scale = 1, gamma = 1, log = FALSE)
```

```
pslaplace(q, mu = 0.05, scale = 1, gamma = 1)
```

```
qslaplace(p, mu = 0.05, scale = 1, gamma = 1)
```

```
rslaplace(n, mu = 0.05, scale = 1, gamma = 1)
```

Arguments

x	vector of values.
mu	location parameter.
scale	scale parameter.
gamma	skewness parameter.
log	flag for log density.
q	vector of quantiles.
p	vector of probabilities.
n	number of observations.

Value

A vector of density, distribution function, quantile or random values.

sst	<i>Skew Student t distribution</i>
-----	------------------------------------

Description

Skew Student t distribution

Usage

```
psst(q, df = 10, gamma = 1, mu = 0, sigma = 1)
```

```
qsst(p, df, gamma, mu, sigma)
```

```
dsst(x, df, gamma, mu, sigma, log = FALSE)
```

```
rsst(n, df, gamma, mu, sigma)
```

Arguments

q	vector of quantiles.
df	degrees of freedom.
gamma	skewness parameter.
mu	location parameter.
sigma	scale parameter.
p	vector of probabilities.
x	vector of values.
log	flag for log density.
n	number of observations.

Value

A vector of density, distribution function, quantile or random values.

st	<i>Student t distribution</i>
----	-------------------------------

Description

Student t distribution

Usage

```
pst(q, df = 10, mu = 0, sigma = 1)
```

```
qst(p, df, mu, sigma)
```

```
dst(x, df, mu, sigma, log = FALSE)
```

```
rst(n, df, mu, sigma)
```

Arguments

q	vector of quantiles.
df	degrees of freedom.
mu	location parameter.
sigma	scale parameter.
p	vector of probabilities.
x	vector of values.
log	flag for log density.
n	number of observations.

Value

A vector of density, distribution function, quantile or random values.

stochinverse	<i>Stochastic inverse of a v-transform</i>
--------------	--

Description

Stochastic inverse of a v-transform

Usage

```
stochinverse(x, v, tscopula = NULL, tol = .Machine$double.eps^0.75)
```

Arguments

x	an object of class Vtransform .
v	a vector, matrix or time series with values in [0, 1].
tscopula	a time series copula object.
tol	the desired accuracy (convergence tolerance) that is passed to uniroot if numerical inversion is used.

Value

A vector, matrix or time series with values in [0, 1].

Examples

```
stochinverse(Vsymmetric(), c(0, 0.25, 0.5, 0.75, 1))
```

strank	<i>Calculate standardized ranks of data</i>
--------	---

Description

Calculate standardized ranks of data

Usage

```
strank(x)
```

Arguments

x	a vector or time series of data.
---	----------------------------------

Value

A vector or time series of standardized ranks in the interval (0,1)

Examples

```
strank(rnorm(100))
```

swncopula	<i>Constructor function for strict white noise copula process</i>
-----------	---

Description

Constructor function for strict white noise copula process

Usage

```
swncopula()
```

Value

Object of class [swncopula](#).

Examples

```
swncopula()
```

swncopula-class	<i>Strict white noise copula process</i>
-----------------	--

Description

Strict white noise copula process

Usage

```
## S4 method for signature 'swncopula'
sim(object, n = 1000)

## S4 method for signature 'swncopula'
coef(object)

## S4 method for signature 'swncopula'
show(object)
```

Arguments

object	an object of class swncopula .
n	numeric value for length of simulated realisation.

Methods (by generic)

- `sim`: Simulation method for strict white noise copula
- `coef`: Coef method for strict white noise copula
- `show`: Show method for strict white noise copula

Examples

```
sim(swncopula())
```

tscm

Constructor function for time series

Description

Constructor function for time series

Usage

```
tscm(tscopula, margin = new("margin", name = "unif"))
```

Arguments

tscopula an object of class [tscopula](#).
margin an object of class [margin](#).

Value

An object of class [tscm](#).

Examples

```
tscm(dvinecopula(family = "gauss", pars = 0.5), margin("doubleweibull"))
```

tscm-class

Full models

Description

Class of objects for composite time series models consisting of stationary copula processes and marginal distributions.

Usage

```
## S4 method for signature 'tscm'  
show(object)
```

```
## S4 method for signature 'tscm'  
coef(object)
```

```
## S4 method for signature 'tscm'  
sim(object, n = 1000)
```

```
## S4 method for signature 'tscm'
predict(object, data, x, type = "df", qtype = 7, proper = FALSE)
```

```
## S4 method for signature 'tscm'
kendall(object, lagmax = 20)
```

Arguments

object	an object of the class.
n	length of realization.
data	vector of past data values.
x	vector of arguments of prediction function.
type	type of prediction function ("df" for density, "qf" for quantile function or "dens" for density).
qtype	type of empirical quantile estimate.
proper	logical variable stating whether the standard empirical distribution function should be used when the margin is empirical; otherwise an improper distribution that is bounded away from 0 and 1 is used.
lagmax	maximum value of lag.

Methods (by generic)

- show: Show method for tscm class
- coef: Coefficient method for tscm class
- sim: Simulation method for tscm class
- predict: Prediction method for tscm class
- kendall: Calculate Kendall's tau values for pair copulas for tscm class

Slots

tscopula an object of class [tscopula](#).

margin an object of class [margin](#).

Examples

```
mod <- tscm(dvinecopula(family = "gauss", pars = 0.5), margin("doubleweibull"))
sim(mod)
```

tscmfit-class	<i>Fitted tscm model</i>
---------------	--------------------------

Description

Class of objects for fitted [tscm](#) models.

Usage

```
## S4 method for signature 'tscmfit'
logLik(object)

## S4 method for signature 'tscmfit'
resid(object, trace = FALSE)

## S4 method for signature 'tscmfit'
predict(object, x, type = "df", qtype = 7, proper = FALSE)
```

Arguments

object	an object of the class.
trace	extract trace instead of residuals.
x	vector of arguments of prediction function.
type	type of prediction function ("df" for density, "qf" for quantile function or "dens" for density).
qtype	type of empirical quantile estimate.
proper	logical variable stating whether the standard empirical distribution function should be used when the margin is empirical; otherwise an improper distribution that is bounded away from 0 and 1 is used.

Methods (by generic)

- logLik: method for tscmfit class
- resid: Residual method for tscmfit class
- predict: Prediction method for tscmfit class

Slots

tscopula an object of class [tscopula](#).

margin an object of class [margin](#).

data a vector or time series of data to which process has been fitted.

fit a list containing details of the fit.

tscopula-class	<i>Time series copula processes</i>
----------------	-------------------------------------

Description

Class of objects for time series copula processes.

tscopulafit-class	<i>Fitted time series copula processes</i>
-------------------	--

Description

Class of objects for fitted time series copula processes.

Usage

```
## S4 method for signature 'tscopulafit'
sim(object, n = 1000)
```

```
## S4 method for signature 'tscopulafit'
kendall(object, lagmax = 20)
```

```
## S4 method for signature 'tscopulafit'
coef(object)
```

```
## S4 method for signature 'tscopulafit'
show(object)
```

```
## S4 method for signature 'tscopulafit'
logLik(object)
```

```
## S4 method for signature 'tscopulafit'
resid(object, trace = FALSE)
```

```
## S4 method for signature 'tscopulafit'
predict(object, x, type = "df")
```

Arguments

object	an object of class tscopulafit .
n	length of realization.
lagmax	maximum value of lag.
trace	extract trace instead of residuals.
x	vector of arguments of prediction function.
type	type of prediction function ("df" for density, "qf" for quantile function or "dens" for density).

Methods (by generic)

- `sim`: Simulation method for `tscopulafit` class
- `kendall`: Calculate Kendall's tau values for pair copulas for `tscopulafit` class
- `coef`: Coef method for `tscopulafit` class
- `show`: Show method for `tscopulafit` objects
- `logLik`: `logLik` method for `tscopulafit` class
- `resid`: Residual method for `tscopulafit` class
- `predict`: Prediction method for `tscopulafit` class

Slots

`tscopula` an object of class `tscopula`.

`data` a vector or time series of data.

`fit` a list containing details of the fit.

Examples

```
ar1 <- armacopula(list(ar = 0.7))
data <- sim(ar1, 1000)
ar1fit <- fit(ar1, data)
sim(ar1fit)
```

tscopulaU-class

Time series copulas of class tscopulaU

Description

S4 Class union for basic time series copula types. These are `armacopula`, `dvinecopula` and `dvinecopula2`,

V2b

Constructor function for 2-parameter beta v-transform

Description

Constructor function for 2-parameter beta v-transform

Usage

```
V2b(delta = 0.5, kappa = 1)
```

Arguments

delta a value in (0, 1) specifying the fulcrum of the v-transform.
kappa additional positive parameter of v-transform.

Value

An object of class [Vtransform](#).

Examples

```
V2b(delta = 0.45, kappa = 1.2)
```

V2p

Constructor function for 2-parameter v-transform

Description

Constructor function for 2-parameter v-transform

Usage

```
V2p(delta = 0.5, kappa = 1)
```

Arguments

delta a value in (0, 1) specifying the fulcrum of the v-transform.
kappa additional positive parameter of v-transform.

Value

An object of class [Vtransform](#).

Examples

```
V2p(delta = 0.45, kappa = 1.2)
```

V3b *Constructor function for 3-parameter beta v-transform*

Description

Constructor function for 3-parameter beta v-transform

Usage

V3b(delta = 0.5, kappa = 1, xi = 1)

Arguments

delta	a value in (0, 1) specifying the fulcrum of the v-transform.
kappa	additional positive parameter of v-transform.
xi	additional positive parameter of v-transform.

Value

An object of class [Vtransform](#).

Examples

V3b(delta = 0.45, kappa = 1.2, xi = 1.2)

V3p *Constructor function for 3-parameter v-transform*

Description

Constructor function for 3-parameter v-transform

Usage

V3p(delta = 0.5, kappa = 1, xi = 1)

Arguments

delta	a value in (0, 1) specifying the fulcrum of the v-transform.
kappa	additional positive parameter of v-transform.
xi	additional positive parameter of v-transform.

Value

An object of class [Vtransform](#).

Examples

```
V3p(delta = 0.45, kappa = 0.8, xi = 1.1)
```

Vdegenerate

Constructor function for degenerate v-transform

Description

Constructor function for degenerate v-transform

Usage

```
Vdegenerate()
```

Value

An object of class [VtransformI](#).

Examples

```
Vdegenerate()
```

vdownprob

Calculate conditional down probability of v-transform

Description

Calculate conditional down probability of v-transform

Usage

```
vdownprob(x, v)
```

Arguments

x an object of class [Vtransform](#).
v a vector or time series with values in [0, 1].

Value

A vector or time series of values of gradient.

Examples

```
vdownprob(V2p(delta = 0.55, kappa = 1.2), c(0, 0.25, 0.5, 0.75, 1))
```

vgradient	<i>Calculate gradient of v-transform</i>
-----------	--

Description

Calculate gradient of v-transform

Usage

```
vgradient(x, u)
```

Arguments

x an object of class [Vtransform](#).
u a vector or time series with values in [0, 1].

Value

A vector or time series of values of gradient.

Examples

```
vgradient(Vsymmetric(), c(0, 0.25, 0.5, 0.75, 1))
```

vinverse	<i>Calculate inverse of v-transform</i>
----------	---

Description

If the [Vtransform](#) object is also a [VtransformI](#) object (an invertible v-transform) then the analytical inverse is used. Otherwise an inverse is found by numerical root finding with [uniroot](#).

Usage

```
vinverse(x, v, tol = .Machine$double.eps^0.75)
```

Arguments

x an object of class [Vtransform](#).
v a vector or time series with values in [0, 1].
tol the desired accuracy (convergence tolerance) that is passed to [uniroot](#) if numerical inversion is used.

Value

A vector or time series with values in [0, 1].

Examples

```
vinverse(Vsymmetric(), c(0, 0.25, 0.5, 0.75, 1))
```

Vlinear*Constructor function for linear v-transform*

Description

Constructor function for linear v-transform

Usage

```
Vlinear(delta = 0.5)
```

Arguments

delta a value in (0, 1) specifying the fulcrum of the v-transform.

Value

An object of class [VtransformI](#).

Examples

```
Vlinear(delta = 0.45)
```

Vsymmetric*Constructor function for symmetric v-transform*

Description

Constructor function for symmetric v-transform

Usage

```
Vsymmetric()
```

Value

An object of class [VtransformI](#).

Examples

```
Vsymmetric()
```

vtrans	<i>Evaluate a v-transform</i>
--------	-------------------------------

Description

Evaluate a v-transform

Usage

```
vtrans(x, u)
```

Arguments

x	an object of class Vtransform .
u	a vector or time series with values in [0, 1].

Value

A vector or time series with values in [0, 1].

Examples

```
vtrans(Vsymmetric(), c(0, 0.25, 0.5, 0.75, 1))
```

Vtransform-class	<i>Class of v-transforms</i>
------------------	------------------------------

Description

This is the class of v-transforms. It contains the [VtransformI](#) subclass consisting of v-transforms with an analytical expression for the inverse.

Usage

```
## S4 method for signature 'Vtransform'
show(object)
```

```
## S4 method for signature 'Vtransform'
coef(object)
```

Arguments

object	an object of the class.
--------	-------------------------

Methods (by generic)

- show: Show method for Vtransform class
- coef: Coef method for Vtransform class

Slots

name a name for the v-transform of class character.

Vtrans function to evaluate the v-transform.

pars vector containing the named parameters of the v-transform.

gradient function to evaluate the gradient of the v-transform.

Examples

```
V2p(delta = 0.5, kappa = 1.2)
```

VtransformI-class *Class of invertible v-transforms*

Description

This class inherits from the [Vtransform](#) class and contains v-transforms with an analytical expression for the inverse.

Slots

name a name for the v-transform of class character.

Vtrans function to evaluate the v-transform.

pars vector containing the named parameters of the v-transform.

gradient function to evaluate the gradient of the v-transform.

inverse function to evaluate the inverse of the v-transform.

Examples

```
Vlinear(delta = 0.55)
```

vtscopula	<i>Constructor function for vtscopula object</i>
-----------	--

Description

Constructor function for vtscopula object

Usage

```
vtscopula(tscopulaU, Vtransform = Vlinear(), Wcopula = swncopula())
```

Arguments

tscopulaU	an object of class armacopula , dvinecopula or dvinecopula2 .
Vtransform	an object of class Vtransform .
Wcopula	an object of class tscopula .

Value

An object of class [vtscopula](#).

Examples

```
copobject <- armacopula(pars = list(ar = 0.6, ma = 0.2))
vtscopula(copobject, Vtransform = V2p())
```

vtscopula-class	<i>Time series copula processes with v-transforms</i>
-----------------	---

Description

Class of objects for v-transformed time series copula processes.

Usage

```
## S4 method for signature 'vtscopula'
show(object)

## S4 method for signature 'vtscopula'
coef(object)

## S4 method for signature 'vtscopula'
predict(object, data, x, type = "df")

## S4 method for signature 'vtscopula'
```

```
sim(object, n = 1000)

## S4 method for signature 'vtscopula'
kendall(object, lagmax = 20)
```

Arguments

object	an object of the class.
data	vector of past data values.
x	vector of arguments of prediction function.
type	type of prediction function ("df" for density, "qf" for quantile function or "dens" for density).
n	length of realization.
lagmax	maximum value of lag.

Methods (by generic)

- show: Show method for vtscopula objects
- coef: Coef method for vtscopula class
- predict: Prediction method for vtscopula class
- sim: Simulation method for vtscopula class
- kendall: Calculate Kendall's tau values for vtscopula model

Slots

Vcopula object of class [tscopulaU](#).
 Vtransform object of class [Vtransform](#).
 Wcopula object of class [tscopula](#).

Examples

```
copobject <- armacopula(pars = list(ar = 0.6, ma = 0.2))
sim(vtscopula(copobject, Vtransform = V2p()))
mod <- vtscopula(armacopula(list(ar = 0.95, ma = -0.85)))
kendall(mod)
```
