

Models with Random Effects

- Levels are a random sample
- Variability between levels is of interest
- Nested vs. crossed factors

One Random Factor

Serum measurements of blood samples
Model:

$$Y_{ij} = \mu + a_i + \epsilon_{ij}, \quad i = 1, \dots, I; j = 1, \dots, J$$

a_i random effect of sample i , $a_i \sim \mathcal{N}(0, \sigma_a^2)$,

ϵ_{ij} error of j th measurement of sample i , $\epsilon_i \sim \mathcal{N}(0, \sigma_e^2)$,

a_i and ϵ_{ij} are all independent.

$$\text{Var}(Y_{ij}) = \text{Var}(a_i + \epsilon_{ij}) = \sigma_a^2 + \sigma_e^2, \quad \text{Cov}(Y_{ij}, Y_{ij'}) = \sigma_a^2$$

The variance of Y_{ij} consists of two components. Such models are also called **variance components models**.

Anova Table

$$H_0 : \sigma_a^2 = 0 \quad H_A : \sigma_a^2 > 0$$

Source	SS	df	MS=SS/df
Sample	$SS_a = \sum \sum (y_{i.} - y_{..})^2$	$I - 1$	MS_a
Residual	$SS_{res} = \sum \sum (y_{ij} - y_{i.})^2$	$N - I$	MS_{res}
Total	$SS_{tot} = \sum \sum (y_{ij} - y_{..})^2$	$N - 1$	

Parameter estimations

$$\hat{\sigma}_e^2 = MS_{res}$$

$$\hat{\sigma}_a^2 = (MS_a - MS_{res})/J \quad \text{can be negative!}$$

$$\hat{\mu} = y_{..} \quad \text{with } Var(\hat{\mu}) = \frac{1}{I}(\sigma_a^2 + \sigma_e^2/J)$$

Either Maximum Likelihood estimators or $\hat{\sigma}_a^2 \geq 0$

Variability between Laboratories

$$Y_{ijk} = \mu + a_i + b_j + \epsilon_{ijk}$$

a_i random effect of lab i , $a_i \sim \mathcal{N}(0, \sigma_a^2)$,
 b_j random effect of sample j , $b_j \sim \mathcal{N}(0, \sigma_b^2)$,
 ϵ_{ijk} measurement error, $\epsilon_{ijk} \sim \mathcal{N}(0, \sigma_e^2)$,
 all random variables are independent.

Source	df	E(MS)	F
Lab	$I - 1$	$\sigma_e^2 + JK\sigma_a^2$	MS_a/MS_{res}
Sample	$J - 1$	$\sigma_e^2 + IK\sigma_b^2$	MS_b/MS_{res}
Residual	$\ll diff \gg$	σ_e^2	
Total	$IJK - 1$		

Parameter Estimation

$$\hat{\sigma}_e^2 = MS_{res}$$

$$\hat{\sigma}_a^2 = (MS_a - MS_{res})/JK$$

$$\hat{\sigma}_b^2 = (MS_b - MS_{res})/IK$$

Model with Interaction Lab*Sample

Source	E(MS)	H_0	F
Lab	$\sigma_e^2 + JK\sigma_a^2 + K\sigma_{ab}^2$	$\sigma_a^2 = 0$	MS_a/MS_{ab}
Sample	$\sigma_e^2 + IK\sigma_b^2 + K\sigma_{ab}^2$	$\sigma_b^2 = 0$	MS_b/MS_{ab}
Lab : Sample	$\sigma_e^2 + K\sigma_{ab}^2$	$\sigma_{ab}^2 = 0$	MS_{ab}/MS_{res}
Residual	σ_e^2		

$H_0 : \sigma_a^2 = 0$ Test statistic: $F = MS_a/MS_{ab}$

$H_0 : \sigma_a^2 = \sigma_{ab}^2 = 0$ Test statistic: $F = MS_a/MS_{res}$

Nested Designs

Factors Lab and Sample are not **crossed**, but **nested**.

Source	df	E(MS)
Lab	$I - 1$	$\sigma_e^2 + K\sigma_b^2 + JK\sigma_a^2$
Sample	$I(J - 1)$	$\sigma_e^2 + K\sigma_b^2$
Residual	$\langle diff \rangle$	σ_e^2
Total	$IJK - 1$	

Moisture Content of Cowpea

Effect of milling on moisture content. 3 samples of 100g from 5 batches were milled. From each sample 10g are measured.

batch	sample								
	1	2	3	4	5	6	7	8	9
1	9.3	9.2	8.8	8.6	8.7	9.9	8.9	8.7	8.5
2	8.0	8.2	9.2	9.7	9.4	8.2	9.3	9.5	9.4
3	11.0	10.7	9.9	9.3	13.9	9.2	9.2	10.9	9.7
4	10.1	10.2	9.9	8.6	9.4	8.3	8.3	9.9	9.5
5	12.0	9.3	10.8	12.2	9.6	11.7	11.4	9.8	12.4

Anova Table

```
> mod1=aov(moisture~batch/sample)
```

```
> summary(mod1)
```

	Df	Sum Sq	Mean Sq	F value	Pr(>F)	
batch	4	30.928	7.7320	7.0390	0.0004027	**
batch:sample	10	5.911	0.5911	0.5381	0.8491520	
Residuals	30	32.953	1.0984			

$$\hat{\sigma}_e^2 = 1.0984$$

$$\hat{\sigma}_e = 1.048$$

$$\hat{\sigma}_s^2 = (0.5911 - 1.0984)/3 = 0$$

$$\hat{\sigma}_s = 0$$

$$\hat{\sigma}_b^2 = (7.732 - 1.0984)/9 = 0.737$$

$$\hat{\sigma}_b = 0.858$$

Linear mixed-effects model fit

```
> summary(lme(moisture~1,random=~1|batch/sample))
