# Applied Time Series Analysis

## SS 2014 – Week 08

### ***Non-Stationary Models: ARIMA and SARIMA***

#### **Why?**

We have seen that many time series we encounter in practice show trends and/or seasonality. While we could decompose them and model the stationary part, it might also be attractive to directly model a non-stationary series.

#### **How does it work?**

There is a mechanism, "the integration" or "the seasonal integration" which takes care of the deterministic features, while the remainder is modeled using an ARMA(p,q).

#### **There are some peculiarities!**

→ **see blackboard!**

### *Differencing Yields a Stationary Series*

Differences of Logged Monthly Crude Oil Prices

# Applied Time Series Analysis

## SS 2014 – Week 08

### ***ARIMA(p,d,q)-Models***

**Idea:** Fit an ARMA(p,q) to a time series where the d<sup>th</sup> order difference with lag 1 was taken before.

**Example:** If  $Y_t = X_t - X_{t-1} = (1-B)X_t \sim ARMA(p, q)$ ,  
then  $X_t \sim ARIMA(p, 1, q)$

**Notation:** With backshift-operator B()

$$\Phi(B)(1-B)^d X_t = \Theta(B)E_t$$

**Stationarity:** ARIMA-models are usually non-stationary!

**Advantage:** it's easier to forecast in R!

## SS 2014 – Week 08

### *Fitting an ARIMA in R*

We start by fitting an ARIMA(1,1,2) to the oil series:

```
> arima(lop, order=c(1,1,2))
```

Call:

```
arima(x = lop, order = c(1, 1, 2))
```

Coefficients:

	ar1	ma1	ma2
	0.8429	-0.5730	-0.3104
s.e.	0.1548	0.1594	0.0675

```
sigma^2 = 0.0066: ll = 261.88, aic = -515.75
```

# Applied Time Series Analysis

## SS 2014 – Week 08

### *Alternative Fitting*

Instead of fitting an ARIMA(1,1,2) to the logged oil series, we can also take the differenced log-oil series and fit an ARMA(1,2) to it.

#### **IMPORTANT:**

In this case, we have to do fitting without including an intercept (why?), thus:

```
> arima(diff(log(oil.price)), order=c(1,0,2),  
        include.mean=FALSE)
```

# Applied Time Series Analysis

## SS 2014 – Week 08

### *Meaning of the Model / Recipe*

We can rewrite the ARIMA(1,1,2) model as an ARMA(2,2),  
**see blackboard...**

Some guidelines on how to fit ARIMA models to observed time series can also be found **on the blackboard...**

## SS 2014 – Week 08

### ***ACF/PACF of SARIMA(p,d,q)(P,D,Q)<sup>s</sup>***

# Applied Time Series Analysis

## SS 2014 – Week 08

### *Modeling the Airline Data*

Since there are “big gaps” in ACF/PACF:

$$\begin{aligned}Z_t &= (1 + \beta_1 B)(1 + \gamma_1 B^{12})E_t \\ &= E_t + \beta_1 E_{t-1} + \gamma_1 E_{t-12} + \beta_1 \gamma_1 E_{t-13}\end{aligned}$$

This is an MA(13)-model with many coefficients equal to 0, or equivalently, a SARIMA(0,1,1)(0,1,1)<sup>12</sup>.

**Note:** Every SARIMA(p,d,q)(P,D,Q)<sup>s</sup> can be written as an ARMA(p+sP,q+sQ), where many coefficients will be equal to 0.

# Applied Time Series Analysis

## SS 2014 – Week 08

### ***SARIMA(p,d,q)(P,D,Q)<sup>s</sup>***

The general notation is:

$$Z_t = (1 - B)^d (1 - B^s)^D X_t$$

$$\Phi(B)\Phi_s(B^s)Z_t = \Theta(B)\Theta_s(B^s)E_t$$

Interpretation:

- one typically chooses  $d=D=1$
  - $s$  = periodicity in the data (season)
  - $P, Q$  describe the dependency on multiples of the period
- **see blackboard...**

### ***Outlook to Non-Linear Models***

#### **What are linear models?**

Models which can be written as a linear combination of  $X_t$ ,  
i.e. all AR-, MA- and ARMA-models

#### **What are non-linear models?**

Everything else, e.g. non-linear combinations of  $X_t$ ,  
terms like  $X_t^2$  in the linear combination, and much more!

#### **Motivation for non-linear models?**

- modeling cyclic behavior with quicker increase than decrease
- non-constant variance, even after transforming the series

### *Fitting an ARCH(2) Model*

R allows for convenient fitting...

```
> fit <- garch(lret.smi, order = c(0,2))  
> fit
```

```
Call: garch(x = lret.smi, order = c(0, 2))
```

```
Coefficient(s):
```
